ULTRASOUND REPORT

Chest Ultrasound

Follow-up since December 22, 2018

Free loculated pleural fluid is seen in both hemithoraces with approximate volume of 1,154 cc in the right and 446 cc in the left. Associated passive atelectasis of the bilateral adjacent lung is seen.

Surface marker is provided in the right postero-lateral hemithorax and fluid can be reached at a depth of 2.6 cm perpendicular from the skin.

IMPRESSION

Bilateral pleural effusion, massive in the right and moderate in the left with partial volume loss of the bilateral lower lung.
